RFC 9579

Use of Password-Based Message Authentication Code 1 (PBMAC1) in PKCS #12 Syntax

Abstract

This document specifies additions and amendments to RFCs 7292 and 8018. It defines a way to use the Password-Based Message Authentication Code 1 (PBMAC1), defined in RFC 8018, inside the PKCS #12 syntax. The purpose of this specification is to permit the use of more modern Password-Based Key Derivation Functions (PBKDFs) and allow for regulatory compliance.

Status of This Memo

This document is not an Internet Standards Track specification; it is published for informational purposes.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Not all documents approved by the IESG are candidates for any level of Internet Standard; see Section 2 of RFC 7841.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at <https://www.rfc-editor.org/info/rfc9579>.

1. Introduction

The PKCS #12 format [[RFC7292](#)] is widely used for the interoperable transfer of certificate, key, and other miscellaneous secrets between machines, applications, browsers, etc. Unfortunately, the original specification mandates the use of a specific password-based key derivation function, the PBKDF1, that only allows for change of the underlying message digest function.

2. Rationale

Due to security concerns with PBKDF1 and the much higher extensibility of PBMAC1 [[RFC8018](#)], we propose the use of PBMAC1 for integrity protection of PKCS #12 structures. The new syntax is designed to allow legacy applications to still be able to decrypt the key material, even if they are unable to interpret the new integrity protection, provided that they can ignore failures in Message Authentication Code (MAC) verification. This change allows for the use of PBKDF2 [[RFC8018](#)] or script PBKDFs [[RFC7914](#)] for derivation of MAC keys and future extensibility. Use of the extensible PBMAC1 mechanism also allows for greater flexibility and alignment with different government regulations, for example, in environments where PBKDF2 is the only allowed password-based key derivation function.

As the recommended methods for key protection require both encryption and integrity protection, we decided to amend the PKCS #12 format to support different key derivation functions rather than extending the PKCS #5 format by a new field that allows integrity protection.

We included an ASN.1 module [[x680](#)] [[x681](#)] [[x682](#)] [[x683](#)] [[x690](#)] that can be combined with the ASN.1 module in [[RFC8018](#)] to incorporate additional MAC algorithms.

3. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

4. Embedding PBMAC1 in PKCS #12

The MacData structure in the Personal Information Exchange (PFX) object, as described in item #3 in [Section 4](#) of [[RFC7292](#)], is updated to include the following PBMAC1-specific guidance:

1. The id-PBMAC1 object identifier is permitted as a valid type for the DigestAlgorithmIdentifier inside the DigestInfo object. If the algorithm field of the DigestAlgorithmIdentifier is id-PBMAC1, then the parameters field **MUST** be present and have a value consistent with PBMAC1-params.

2. If the PBMAC1 algorithm is used, the digest value of the DigestInfo object **MUST** be the result of the PBMAC1 calculation over the authSafe field using the PBMAC1-params parameters.
3. If the PBMAC1 algorithm is used, the macSalt value **MUST** be ignored. For backwards compatibility, it **SHOULD NOT** be empty.
4. If the PBMAC1 algorithm is used, the iterations value **MUST** be ignored. For backwards compatibility, it **SHOULD** have a non-zero positive value.

5. Recommended Parameters

To provide interoperability between different implementations, all implementations of this specification **MUST** support the PBKDF2 key derivation function paired with SHA-256 HMAC [[SHA2](#)] [[RFC2104](#)] for both integrity check and as the PBKDF2 pseudorandom function (PRF). It's **RECOMMENDED** for implementations to support other SHA-2-based HMACs. Implementations **MAY** use other hash functions, like the SHA-3 family of hash functions [[SHA3](#)]. Implementations **MAY** use other KDF methods, like the scrypt PBKDF [[RFC7914](#)].

The length of the key generated by the used KDF **MUST** be encoded explicitly in the parameters field and **SHOULD** be the same size as the HMAC function output size. This means that PBMAC1-params specifying SHA-256 HMAC should also include KDF parameters that generate a 32-octet key. In particular, when using the PBKDF2, implementations **MUST** include the keyLen field in the encoded PBKDF2-params. Implementations **MUST NOT** accept PBKDF2 KDF with PBKDF2-params that omit the keyLen field.

6. Password Encoding

As documented in [Appendix B.1](#) of [[RFC7292](#)], the handling of password encoding in the underlying standards is underspecified. However, just as with PBES1 and PBES2 when used in the context of PKCS #12 objects, all passwords used with PBMAC1 **MUST** be created from BMPStrings with a NULL terminator.

7. Deprecated Algorithms

While attacks against SHA-1 HMACs are not considered practical [[RFC6194](#)] to limit the number of algorithms needed for interoperability, implementations of this specification **SHOULD NOT** use PBKDF2 with the SHA-1 HMAC. In addition, implementations **MUST NOT** use any other message digest functions with an output of 160 bits or less.

8. IANA Considerations

IANA has registered the following object identifier in the "SMI Security for S/MIME Module Identifier (1.2.840.113549.1.9.16.0)" registry. See [Appendix B](#) for the ASN.1 module.

Decimal	Description	Reference
76	id-pkcs12-pbmac1-2023	RFC 9579

Table 1

9. Security Considerations

Except for the use of different key derivation functions, this document doesn't change how the integrity protection on PKCS #12 objects is computed; therefore, all the security considerations from [RFC7292] apply.

Use of PBMAC1 and PBKDF2 is unchanged from [RFC8018]; therefore, all the security considerations from [RFC8018] apply.

The KDFs generally don't have a lower limit for the generated key size, allowing the specification of very small key sizes (of 1 octet), which can facilitate brute-force attacks on the HMAC. Since the KDF parameters are not cryptographically protected and HMACs accept arbitrary key sizes, implementations **MAY** refuse to process KDF parameters that specify small key output sizes or weak parameters. It's **RECOMMENDED** to reject any KDF parameters that specify key lengths less than 20 octets.

Appendix B. ASN.1 Module

This appendix documents ASN.1 [[x680](#)] [[x681](#)] [[x682](#)] [[x683](#)] [[x690](#)] types, values, and object sets for this specification. It does so by providing an ASN.1 module called PKCS12-PBMAC1-2023.

Combine this module with the PKCS-12 ASN.1 module found in [Appendix D](#) of [[RFC8018](#)] to add SHA-2-based HMACs by replacing the PBKDF2-PRFs class found therein.

```

PKCS12-PBMAC1-2023
{ iso(1) member-body(2) us(840) rsadsi(113549) pkcs(1) pkcs9(9)
  smime(16) id-mod(0) id-pkcs12-pbmac1-2023(76) }
